*\*Twisted nematic (TN) display is a common type of liquid-crystal display (LCD) that consists of a substance called a nematic liquid crystal that is confined between two plates of polarized glass.*

*\*IPS (in plane switching) is a screen technology used for liquid crystal displays (LCDs). IPS technology shows uniform color temperature across the panel, enabling you to see consistent color and brightness across a wide viewing angle. Recognized as one of the best panel technologies for lifelike color, IPS technology is an excellent choice for work that depends on accurate color..*
